Java Programming Language is better Than C# (C Sharp) Programming Language

By Sebastian Agius

Is Java Better Than, C#? What's the difference they make? Java has way simpler ways to program than C#, the possibilities with Java is endless, and is easier to use, C# is just a waste of time, and you have to program it again for each platform. Globally we know that Java is more useful and is better to use.

Firstly, with the Java Programming Language, you can create many things easily, especially frames in java (it is called a JFrame in Java Programming Language). Especially with oracles' Netbeans IDE you can create a frame (Window) in five seconds and drag and drop buttons, lists, ETC. And it is easy to manage Events by right clicking you can choose the Events you want each thing to do from the methods, you have created!

Secondly, the possibilities with Java are Endless, and it has easy imports from the original Java Code, and you can add libraries Jar Files and import their code into your project for making things such as plug-ins. Like the popular Game Minecraft, it is made with Java, and seeing that the developers' potential shows you and us that Java has Unlimited Possibilities. Many games are made with Java, and you know what I want, and you want, Java to be on Apple Devices, such as iPhones, iPods, iPads, ETC. That will let the game developers of Java games to reach their full potential and make their game the exact same as their PC Version.

Lastly, there is one bad thing, which is annoying to C# users, whenever you create a windows game for example you have to program it again for another

platformer, such as Mac, but in a different way. Say You want to make a game on xBox, PlayStation, and Windows and Mac, the same game, you would have to program it 4 times, and if you want it on both PS3 and PS4, xBox360 and xBox1, you would need to program it 6 times, (Including Mac and Windows.) and with the Mac, and windows, you can't really allocate as much memory, so that's another change.

Summing up all this great stuff about Java and the crazy stuff about C# I and you should both agree that Java is much better at many things than the time wasting C#!!!
